TOP PRICES OF THE SALE

The culture and preparation of tea

In countries like England and Australia, where people are heavy tea drinkers, the food value of the tea beverage taken daily forms an appreciable fraction of the diet. A black tea infusion contains, in addition to caffeine and oxidized polyphenols, small quantities of protein bodies are carbohydrates. Neither are, however, present in sufficient quantity to be of appreciable value in the normal diet of the average person. A cup of tea even when taken with milk contains only about 20 grains of proteins. This amount is small when it is considered that the average man requires 1,300 grains protein each day, and usually consumes much more.

The actual calorific value of a cup of tea, containing 6 fluid oz. has been put at 4 calories, which may be compared with a similar cup of coffee which supplies 11 and a cup of milk which supplies about 107 calories. The calorie is used as a measure of energy turnover in animals, and an active man requires 2,000 calories of heat when burned must be provided to maintain that energy output. A cup of tea containing a tablespoon of milk (10 calories) and one lump of sugar (25 calories) yields about 40 calories.
