TOP PRICES OF THE SALE

The culture and preparation of tea

In North-East India the bush is formed as follows. About a year after planting it has grown into a conical plant 4 to 5 ft. high, which is then cut across flat in November or December, 18 in. above ground level and perhaps one center branch removed. The bush is allowed to grow up the following spring but is plucked, level with the ground, when it reaches about 30 in., and is kept plucked flat at that height. Next year or the year after it is again pruned back level to about 18 or 20 in. and in due course plucked flat again at 30in. Then each year or alternate year the bush is cut back, a little higher each time, on 1 in. or ½ in. of new wood. After twenty-five years or so, the bush may be getting too high for plucking, since this operation calls for a run of about 6 in. of new growth above the pruning level. In this event, the bush is medium pruned back to about 24 in., and the cycle of pruning started again. After a further fifteen to twenty-five years; total forty to fifty years from planting the area probably needs uprooting and replanting. However, many areas in Assam are at the age of sixty years still giving crops of 1,200 lb. tea per area.
