**The culture and preparation of tea**

In Japan, the year after thinning out the lines of seeding, the shaping of the bush is begun. At the first pruning, the plants are cut evenly to about 12 in. high and thereafter, for growth is cut back to 4 in. In this way a compound bush 30 to 36 in. high trimmed at 9th the close of the year, and the twigs and old leaves so produced are made into coarse tea or used to make brick tea. At intervals of five to ten years in others, the bushes are rejuvenated by heavy cutting back. The mature bush consists of a clump of gnarled, single-stemmed plants, each branching to fill up its own are in the dome-shaped plucking surface which extends from the crown of the hedge down to the soil. With the Assam type of bush and style of planting the problem is different. A single plant has to be dealt with which in its natural state would form a conical tree 15 to 30 ft. high. For the convenience of plucking this must be kept to a height of about 3 ft., and for the plucking surface to meet its neighboring bushes.
